

SCREWLine³

High efficiency air cooled liquid chiller for outdoor installation

WDAT-SL3 200.2 - 580.2 RANGE

Nominal cooling capacity from 467 kW to 1430 kW

- ▶ R-134a double screw compressors
- ▶ Two independent refrigeration circuits
- ▶ Modulating capacity control (stepless) up to 12,5% of the load
- ▶ Chilled water down to -12°C
- ▶ Total / partial recovery of the condensing heat

EXCELLENCE version

- ▶ Eurovent Class A / Up to 52°C outdoor air temperature / Perfect for LEED

PREMIUM version

- ▶ Eurovent Class C / Compact version

Clivet is taking part in the EUROVENT certification programme up to 600 kW. The products concerned appear in the certified products list of the EUROVENT www.eurovent-certification.com site.

Clivet hydronic system

Designed to provide high energy efficiency and sustainability of the investment, the wide range of Clivet liquid chillers and heat pumps for high efficiency air conditioning of Residential and Commercial spaces and for Industrial applications it is available with air or water source.

HYDRONIC System - Air Source

Specialization

Every intended use has specific requirements which determine the overall efficiency. For this, the Clivet hydronic system always offers the best solution in every project.

- Modular range with over 8000 kW of overall capacity
- Capacity control with Screw and modular Scroll technology
- Multifunction versions
- Outdoor or indoor (ductable type) installation

Centrality of the Air Renewal

From the Air Renewal depends the comfort in the spaces. Since it often represents the main building energetic load, it also determines the running costs of the entire system.

ZEPHIR3
Packaged Primary Air supply system with thermodynamic energy recovery.

- Simplifies the system, reduces the heating and cooling generators
- Purifies the air with standard electronic filters
- Increases the energy efficiency and it also allows a savings of 40% on the running costs
- From -40°C to +50°C of outdoor air temperature

Terminal and AHU complete system

The hydronic terminal units are very diffused for their versatility and reliability. The Clivet range includes many versions that simplify the application in different types of installation and building.

ELFOSpace
High energy efficiency hydronic terminal units
AQX
Air-conditioning unit

- Cased and uncased terminal units, from 1 to 90 kW
- Horizontal and vertical installation
- Energy-saving DC fans
- Modular air conditioning units up to 160.000 m³/h
- EUROVENT certification

SCREWLine³: Screw technology for an efficient and versatile product

SCREWLine³ is the new generation of Clivet liquid chillers with Screw compression technology: high energy efficiency, great operating reliability and maximum choice versatility, with many versions and models for different types of installation.

WDAT-SL3

Air cooled water chiller

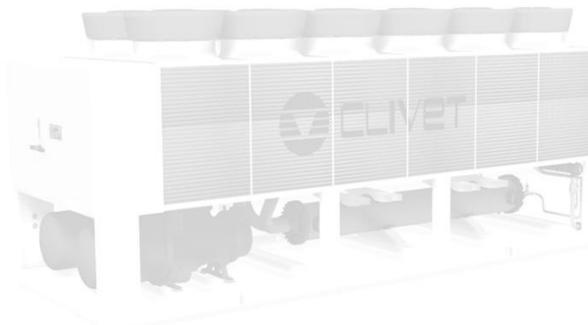

- EXCELLENCE high efficiency version and PREMIUM compact version
- Continuous capacity control
- Operating with 52°C of outdoor air temperature
- Total / partial recovery of the condensing heat
- Eurovent certification

WDAT-SL3 FREE-COOLING

Air cooled water chiller with FREE-COOLING

- EXCELLENCE high efficiency version and PREMIUM compact version
- Continuous capacity control
- Direct FREE-COOLING
- Indirect FREE-COOLING (No-Glycol)

Dedicated series separately documented

Precise and economic operating

In air conditioning of buildings and in industrial processes, thermal loads vary over time. The modulating capacity control (stepless) on two refrigeration circuits continually keeps in balance the Clivet unit with the installation, allowing to:

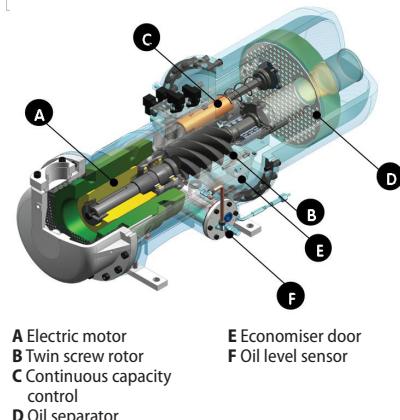

- follow the load also with a great staging
- save supplying only the necessary energy without fluctuations of electric power input
- stabilize the supplied water temperature

New generation of compressors

The new generation of screw compressors is the result of the continuous evolution for the operating range extension and the overcoming of the traditional efficiency limits at partial load.

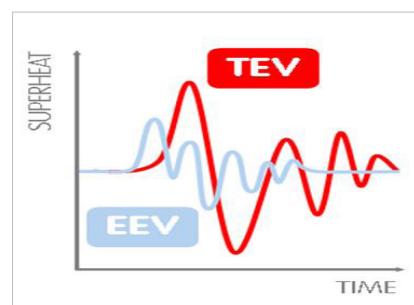

New internal geometry, original lubrication system, electronically controlled, innovative capacity modulating control (stepless) up to 12,5% of the load: they are some of the developments that allow an application versatility and the increase of the seasonal efficiency.

Reliable

The load variability involves the continuous variation of the refrigerant volume moved by compressors. The electronic expansion valve (EEV), standard on Clivet units, adapts rapidly and precisely to the actual load required for usage, allowing stable and reliable control in comparison with mechanical thermostatic valves (TEV). This results also in a further increase in efficiency and longer compressor life.

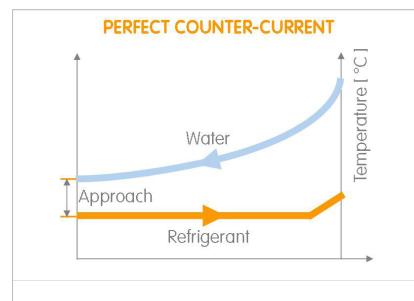

The overheating control allows preventing phenomena that are hazardous to the compressors, such as overtemperature and return fluids, thereby increasing even more efficiency and durability.

Innovative shell and tube exchangers

The Clivet thermodynamic research and the development focused on geometries and materials have led to the use of a new direct expansion shell and tube evaporator for both circuits:

- minimum temperature difference (approach) between refrigerant and leaving water
- the efficiency further increases in all load conditions where only one compressor is operating
- minimum quantity of refrigerant inside the installation

Efficient and silent ventilation technology

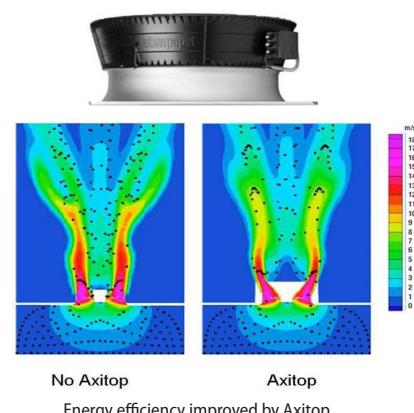

Also the innovative air handling system on the external exchangers is the result of the Clivet design evolution. The new AxiTop diffuser creates an ideal air distribution: it aerodynamically decelerates the flow and transforms a big part of its dynamic energy in static pressure, obtaining:

- -3 dB of sound reduction
- reduction of 3% of the absorbed energy

Moreover all units are supplied with a condensation electronic control. It automatically reduces the fan speed as the heat load drops.

Since fans are the unit's main noise source, the benefits are evident especially during the night hours, when the load is reduced but sensitivity to noise is enhanced.

All this translates into a reduction of sound pressure down to 8 dB(A) compared to full load operation in 90% of operating time of the unit.

Advanced integrated pumping system

Searching the maximum overall efficiency, also the energy used for the heat transfer fluid pumping has its importance.

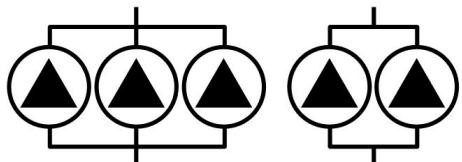

HYDROPACK technology developed by Clivet reduces consumptions and offers an exceptional functional reliability at the same time.

HYDROPACK uses groups of two or three pumps in parallel. It automatically reduces the water flow-rate under critical conditions, avoiding blocks for overload and consequent interventions of specialized technical personnel. It is very useful during start-ups, at restart after operating breaks or after a long period of inactivity.

Thanks to its modularity, HYDROPACK keeps a good water circulation in the installation also if one pump is temporary unavailable. With a deactivated pump, the residual flow-rate is in fact:

- about 80% of the nominal flow-rate (HYDROPACK with 3 pumps)
- about 60% of the nominal flow-rate (HYDROPACK with 2 pumps)

HYDROPACK

Perfect for LEED certification

The whole EXCELLENCE range satisfies both requirements 2 (Minimum Energy Performance) and 3 (Fundamental Refrigerant Management) of Energy and Atmosphere section. They also meet Credit 4 parameters (Enhanced Refrigerant Management) allowing 2 points acquisition.

Clivet is committed in promoting the green building principles and has become a member of GBC Italia. This organization collaborates with USGBC, the U.S. nonprofit organization that promotes worldwide the LEED system of independent certification.

Two versions for each business

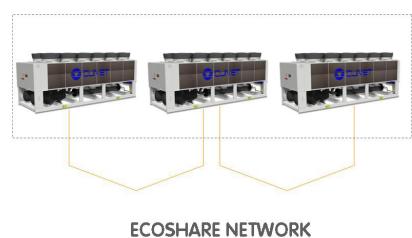

The standard EXCELLENCE version stands out for its extremely high energy efficiency ratio (EER) during full-load cooling, which exceeds the value 3.1 and places it in Eurovent Energy Efficiency class A. It is the best choice for the overall cost reduction throughout the lifespan of the system. Thanks to the generous component sizing, the standard EXCELLENCE is also specialized in the applications with high outdoor air temperature. Reliable and efficient with outdoor air temperature up to 48°C at full load, it is equipped with extended operating at partial load up to 52°C, offering high performances, continuous operating and reduced operating and maintenance costs.

The optional PREMIUM version features the exchanger and structure compact design. It is mainly designed, therefore, for installations focusing on the initial investment.

The advantages of the modular solution

In the event of particularly large buildings requiring high capacities, it is advisable to use several units. The ECOSHARE technology developed by Clivet allows to coordinate up to 7 units in local network, in parallel with modular logic, with the following advantages:

- greater efficiency, because the compressors are sequentially activated exploiting at most their point of operating with the lowest consumption, and the pumping units are activated only when necessary
- greater flexibility, thanks to capability of the automatic control to follow the load
- increased reliability, since the malfunction of one unit does not compromise the capacity supply of the other units.

ECOSHARE NETWORK

Remote system management

The unit is standard equipped with:

- potential-free contact for remote on/off control
- potential-free contacts for the compressor status display
- setting from user interface: Off / local On / serial On
- potential-free contact to remote a general alarm

Thanks to the different communication protocols available, the unit is able to exchange information with the main supervisory systems using serial connections.

Accessories separately supplied

• **RCMRX** - Remote control via microprocessor remote control

• **PSX** - Mains power supply unit

• **AMMX** - Spring antivibration mounts

Further considerations on the installation

The vast operating field of SCREWLine³ allows it to adapt to most system applications.

In some cases, special duty conditions may exceed the unit operating range.

Simple devices on the system allow proper operation and meeting any requirement.

Here are two examples.

Water flow-rate values outside the limits

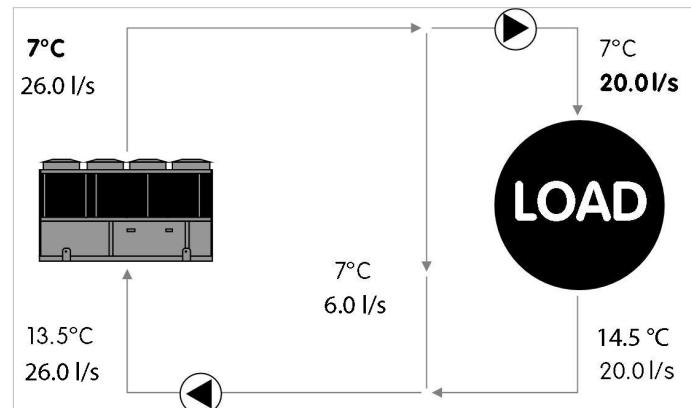

SCREWLine³ operates with constant water flow-rate to the evaporator, between a minimum and maximum value indicated in the technical documents.

Flow-rate values below the limit may cause unwanted formation of ice, incrustations, reduced control precision, and the unit to stop following the intervention of built-in safety devices.

Flow values above the limit may cause high pressure drops, high pumping costs, and reduced control precision, and erosion damages to the exchangers.

In this example, the required flow-rate is lower than the maximum value allowed to the evaporator, while the operating temperatures fall within the functional field of the unit.

A properly sized bypass piping resolves the problem.

Example referred to WDAT-SL3 280.2 EXCELLENCE version. Appropriate water flow-rate for the correct unit operation.

Temperature values outside the limits

SCREWLine³ operates with the system supply temperatures indicated in the technical documentation.

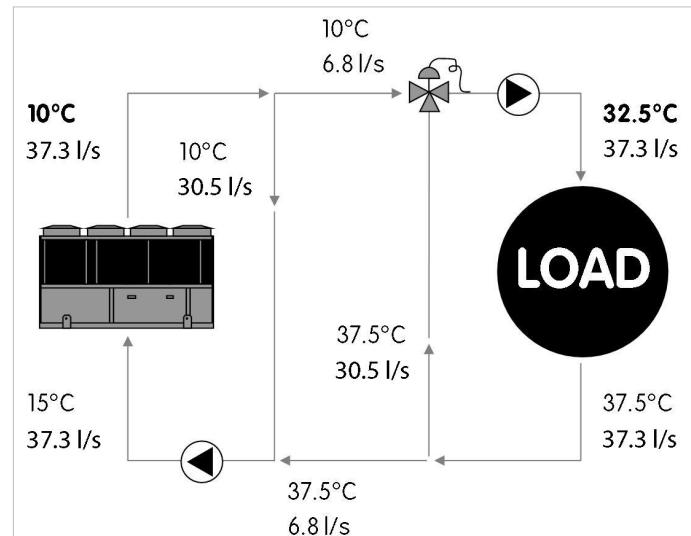

Temperature limits below the limit may cause unwanted formation of ice and the unit to stop following the intervention of built-in safety devices.

Temperature values under the limit may cause malfunctions and damages to the compressors, reduced control precision, and the unit to stop following the intervention of built-in safety devices.

In this example, the required temperature exceeds the maximum value allowed to the evaporator, while the water flow-rate falls within the functional field of the unit.

A properly sized bypass piping and mixing system resolve the problem.

Should both the water flow-rate and the operating temperature exceed the values intended for the chiller, all you have to do is combine the two cases described above.

Example referred to WDAT-SL3 280.2 EXCELLENCE version. Appropriate supply water temperature for the correct unit operation. Nominal water flow-rate with water 15°C-10°C

Evaporator thermal gradient

SCREWLine³ nominal capacities refer to an evaporator thermal gradient equal to 5 °C. A different thermal gradient may be used in full load operation, provided that both the operating flow and temperatures fall within the limits. As an indication, this corresponds to a minimum thermal gradient of approximately 4 °C and a maximum of 7 °C (the exact values must be determined based on the allowed flows and temperatures).

Sound levels refer to full load units, in test nominal conditions. The sound pressure level refers to 1 m. from the standard unit outer surface operating in open field. Measures according to UNI EN ISO 9614-2 regulations, with respect to the EUROVENT 8/1 certification.

Data referred to the following conditions.

internal exchanger water = 12/7 °C Ambient temperature = 35 °C

Size	Sound power level (dB)								Sound power level	Sound pressure level

Sound levels refer to full load units, in test nominal conditions. The sound pressure level refers to 1 m. from the standard unit outer surface operating in open field. Measures according to UNI EN ISO 9614-2 regulations, with respect to the EUROVENT 8/1 certification.

Data referred to the following conditions.

internal exchanger water = 12/7 °C Ambient temperature = 35 °C

OPT = accessory

Data referred to the following conditions:

internal exchanger water = 12/7°C

1. Part load unit and air speed equal to 1 m/s.
2. Part load unit and air speed equal to 0.5 m/s.
3. Part load unit and outdoor air temperature at rest.
4. Unit at full load and outdoor air temperature at rest.

(⁵) The water pumping unit must be fed and connected to the unit according to the manual.

(⁶) Unit without water or containing water with an appropriate quantity of glycol.

At the unit start-up the water temperature or water with glycol must be inside the operating range indicated in the "Operating range" graph.

To know the water freezing temperature on varying the glycol percentage refer to the specific 'Correction factors for glycol use' table.

Air conditions which are at rest are defined as the absence of air flowing towards the unit. Weak winds can induce air to flow through the exchanger and air-levels which can cause a reduction in the operating range. In the presence of predominant winds it is necessary to use suitable windbreak barriers.

Minimum system water content

For a proper functioning of the unit a minimum water content has to be provided to the system, using the formula:

$$\begin{aligned} \text{Minimum water content [l]} &= 7 \times \text{kWf} \text{ (air conditioning application)} \\ &= 14 \times \text{kWf} \text{ (application with low outdoor temperature or low loads required))} \end{aligned}$$

kWf = Nominal cooling capacity unit

Volume calculated does not consider internal heat exchanger (evaporator) water content.

Admissible water flow-rates

Minimum (Qmin) and maximum (Qmax) admissible water flow for the unit to operate correctly.

Standard unit technical specifications

Compressor

Compact, semi hermetic, helicoidal twin-screw compressors: the main screw (male, with five lobes) is driven directly by the electric motor, while the secondary screw (female with six vanes) is driven by the primary one. Continuous modulation of the delivered cooling capacity, with no-load starting. Leak tightness is guaranteed by the extremely accurate tolerances in processing all the moving parts and by specific oil circulation between the screws. Lubrication system with free circulation resulting from pressure differences, equipped with high efficiency separator, oil level indicator and filter (replaceable). Resistance heater for oil heating to prevent excessive dilution by the refrigerant, automatically activated whenever the compressor is off. Two-pole, three-phase, asynchronous electric motor cooled by the sucked-in gas, with Star/Delta reduced-load starting. Fully protected electronic module, with safety sensor for monitoring discharge temperature, sensors for monitoring maximum temperature of the windings, device to control the motor rotation direction and device to monitor absence of phase. Cut-off valve on the discharge line of the refrigerant. Filter on the supply line, at the compressor inlet. Built-in attenuator and non-return valve on the compressor's drain. Automatic safety valve inside the compressor between the high pressure (HP) and low pressure (LP) areas.

Internal exchanger (evaporator)

Direct expansion exchanger with refrigerant side independent circuit for each compressor. The exchanger is composed of a cover made of carbon steel. The tubes, anchored to the tube plate by mechanical expansion, are made of copper, high efficiency, internally rifled to improve thermal exchange and specially designed for use with modern ecological refrigerants. It is also complete with protection differential pressure switch and with a coating made of closed-cell heat insulating material to prevent condensate formation and heat exchange with the outside. The water connections of the exchanger are quick-release with splined joint.

External exchanger (condenser)

Finned exchanger, made of copper pipes arranged in staggered rows and mechanically expanded to adhere better to the fin collar. The exchangers are planned, designed and produced directly by CLIVET. The fins are made of aluminium with a special corrugated surface, with a suitable distance apart to ensure a maximum heat exchange efficiency. The coils are complete with integral subcooling circuit which assures the correct refrigerant feeding of the expansion valve.

Fan

Axial fans with sickle profile blades terminating with "Winglets", directly coupled to the three-phase electronic controlled motor with external rotor. Fans are housed in aerodynamically shaped structures, equipped with accident prevention guards and supplied with variable speed electronic control. Complete with Axitop diffusers to recover dynamic energy, resulting in increased efficiency and minimal sound emission.

Refrigeration circuit

The units are made with two independent refrigeration circuits, each with:

- circuit with economizer exchanger
- electronic expansion valve
- safety high pressure switch
- low pressure safety valve (safety valve with shut-off valve sealed with lead, open for possible inspection)
- high pressure safety valve (safety valve with shut-off valve sealed with lead, open for possible inspection)
- high and low pressure gauges
- replaceable anti-acid solid cartridge dehydrator filter with connection for refrigerant quick charge
- liquid flow and moisture indicator
- cutoff valve on compressor supply
- cutoff valve on liquid line

Electrical panel

The capacity section includes:

- main door lock isolator switch (compulsory to have CE certification)
- isolating transformer for auxiliary circuit power supply
- fan overload circuit breakers
- fuses and thermal relays to protect the compressors
- compressor control contactor
- electrical panel ventilation

The control section includes:

- proportional-integral-derivative (PID) control of water temperature
- antifreeze protection
- unit switching on management by local or remote (serial)
- compressor overload protection and timer
- potential-free contacts for compressor status and enabling
- self-diagnosis system with immediate display of the fault code
- prealarm function for water antifreeze and high refrigerant gas pressure
- compressor operating hour display
- multifunction phase monitor
- remote ON/OFF control
- second set-point enabling by potential-free contact
- automatic rotation control for compressor starts
- relay for remote cumulative fault signal
- display of the set values, the error codes and the parameter index
- high refrigerant gas pressure pre-alarm function that in many cases prevents the unit from being shut-down
- inlet for demand limit (power input limitation according to a 0÷10V or 4÷20 mA external signal)
- interface terminal with graphic display

Accessories

- Spring antivibration mounts (separately supplied accessories)
- Couple of manually operated shut-off valves (separately supplied accessories)
- Progressive compressor start-up device
- Compressor magnetothermic circuit breakers
- Device for the condensing coil partialization
- Device for consumption reduction of the external section Ecobreeze fans
- Device to reduce the consumption levels of on/off fans on the external section
- Power factor correction capacitors ($\cos\phi > 0.9$)
- Energy meter
- Set-point compensation with outdoor air temperature probe
- Set-point compensation with 0-10 V signal
- Set-point compensation with 4-20mA signal
- Serial communication module for BACnet-IP supervisor
- Serial communication module for LonWorks supervisor
- Serial communication module for Modbus supervisor
- Remote control via microprocessor remote control (separately supplied accessories)
- Mains power supply unit (separately supplied accessories)
- ECOSHARE function for the automatic management of a group of units
- Electrical panel antifreeze protection
- Condensing coil protection grilles and technical compartment
- Condensing coil anti-hail protection grilles
- Copper / aluminium condensing coil with acrylic lining
- Copper / aluminium condensing coil with Aluminium Energy Guard DCC treatment

On request are available:

- Copper / copper condensing coil

Test

All the units are factory-tested in specific steps, before shipping them. After the approval, the moisture contents present in all circuits are analyzed, in order to ensure the respect of the limits set by the manufacturers of the different components.

Configurations

SC - Acoustic configuration with compressor soundproofing

Configuration used to increase the unit's silent operation by acting on the source of the noise. It consists of suitable steel casings lined with high-density material designed to provide sound insulation. The casings are secured to an aluminium frame and painted on the outside with polyester powder (RAL 9001).

To assess the quality of the soundproofing benefit, refer to the 'Sound levels' tables.

EN - Super-silenced configuration

Configuration used to increase the unit's silent operation by acting on the source of the noise. It consists of suitable steel casings lined with high-density material designed to provide sound insulation. The casings are secured to an aluminium frame and painted on the outside with polyester powder (RAL 9001).

Fans at low RPM.

To assess the quality of the soundproofing benefit, refer to the 'Sound levels' tables.

B - Water low temperature (Brine)

Configuration also known as "Brine". Enables an "unfreezable" solution to be cooled (for example, water and ethylene glycol in suitable quantities) up to a temperature of between +4°C and -8°C. It includes:

- suitable exchangers with extra-thick closed-cell insulation
- electronic expansion valve, functional calibration and safety devices suitable for particular uses.

During the selection phase it is necessary to indicate the required operating type, the unit will be optimised on the basis of this: - Unit with single operating set-point (only at low temperature) - Unit with double operating set-point.

The unit in this configuration has a different operating field, which was reported in the previous pages.

In low temperature operation, some staging steps could not be available.

The glycol concentration must be chosen based on the minimum temperature the water can reach. The presence of glycol influences pressure drops on the water side and the unit's output as indicated in the table reporting the "correction factors for use with glycol".

The "Extremely low water temperature" option for the chilled water production down to -12°C is available on request.

Correction factor for water low temperature

Evaporator outlet water temperature factor	2	0	-2	-4
Cooling capacity factor	0.860	0.804	0.748	0.692
Compressor power input factor	0.945	0.923	0.901	0.879

The correction coefficients must be applied to condition: internal exchanger water (evaporator) = 12 / 7 °C.

Example: Determine the performance with leaving water temperature -4°C for WDAT-SL3 200.2 EXC ST B (Excellence' version, 'Water low temperature' configuration) with external exchanger water (condenser) 35°C, 30% glycol.

From the performance table referred to entering external exchanger water temperature (condenser) 35 °C and leaving internal exchanger water temperature (evaporator) 7°C:

Cooling capacity = 486 kW, Compressor power input = 141 kW

From the correction factor table for water low temperature: 0.692 for cooling capacity and 0.879 for compressor power input (supply water temperature -4°C)

From the glycol correction factor: 0.964 for cooling capacity, 1.007 for compressor power input, 1.072 the glycol solution flow, 1.3 for the evaporator pressure drop (glycol 30%)

Calculation WDAT-SL3 200.2 EXC ST B: Cooling capacity = $486 \times 0.692 \times 0.964 = 324.2$ kW, Compressor power input = $141 \times 0.879 \times 1.007 = 124.8$ kW

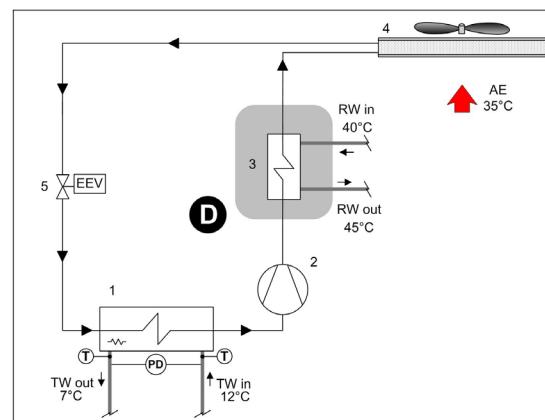

Water flow-rate = 15.5 (calculated on 324.2 kW) $\times 1.072 = 16.6$ l/s, Evaporator pressure drop = 21 (calculated on 15.5 l/s) $\times 1.3 = 27.3$ kPa

D - Partial energy recovery

A configuration which enables the production of hot water free-of-charge while operating in the cooling mode, thanks to the partial recovery of condensation heat that would otherwise be rejected to the external heat source. This option is also called 'desuperheater'. It consists of shell and tube heat exchangers, suitable to recover part of the unit heating capacity (equal to the sum of the cooling capacity and the capacity absorbed by the compressors).

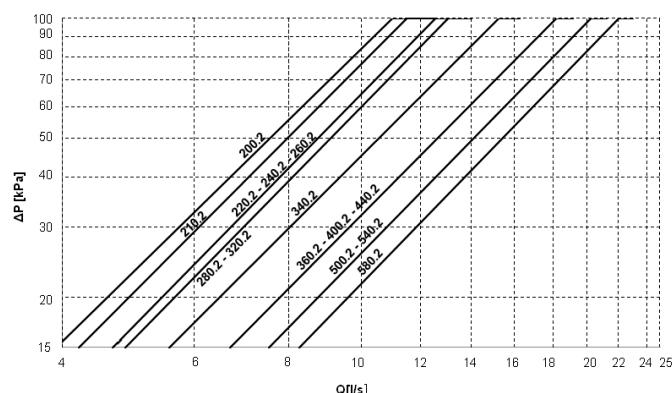

The partial recovery device is considered to be operating when it is powered by the water flow which is to be heated. This condition improves the unit performance, since it reduces the condensation temperature: in nominal conditions the cooling capacity increases indicatively by 3.2% and the power input of the compressors is reduced by 3.6%.

When the temperature of the water to be heated is particularly low, it is wise to insert a flow control valve into the system water circuit, in order to maintain the temperature at the recovery output at above 35°C and thus avoid the condensation of the refrigerant into the partial energy recovery device.

The maximum capacity available from the partial recovery is equal to the 15% of the rejected heating capacity (cooling capacity + compressor power input)

Pressure drops of partial energy recovery exchanger

Q = water flow-rate[l/s]

DP = water side pressure drops (kPa)

Example: Required cooling capacity: 500 kW at 12/7°C chilled water and 35°C outdoor air.

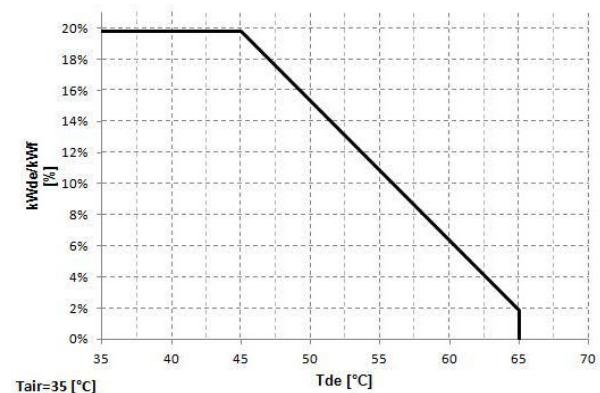

Size purpose of the study: WDAT-SL3 210.2 EXC ST

Hot water required temperature: +45°C

Recovery capacity: 19% di 500 kW = 95 kW

Design flow-rate: 4.5 l/s

Partial recovery heating capacity

$kWde/kWf$ = Heat recovered/Cooling capacity [%]

Tde = Heat recovering device outlet water temperature [°C]

Data refer to outdoor air conditions $T=35^\circ\text{C}$

R - Total energy recovery

A configuration that allows the free production of hot water when operating in cooling mode, thanks to the total recovery of the condensation heat that would otherwise be rejected to the external thermal source. This solution increases the system's overall efficiency in all cases where enhanced hot water production is required. It consists of shell and tube heat exchangers, suitable to recover all the unit heat capacity (equal to the sum of the cooling capacity and electrical capacity absorbed by the compressors), from the on-off solenoid valves, the temperature sensors on the supply and return of the hot water circuit and from the relative built-in control logic at two staging steps. Hot water availability is always subordinate to the production of chilled water. See the following example:

1. cooling capacity request = 100% / Heating capacity request = 0% >Production only of cooling capacity;
2. cooling capacity request = 100% / Heating capacity request = 0% >Production of cooling and heating capacity by recovery;
3. cooling capacity request = 50% / Heating capacity request = 100% >Production of cooling and heating capacity by recovery, equal to the 50% of the requested heating capacity.

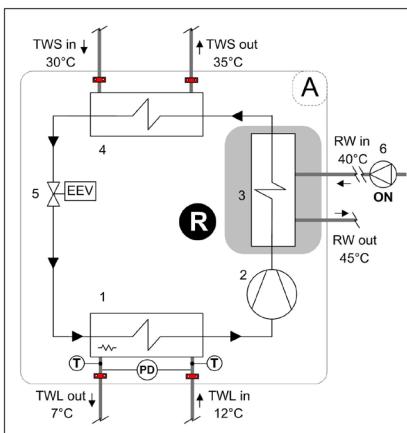

To prevent constant switching in the unit's refrigeration circuit, it is necessary to install a storage tank with an adequate capacity in the system's hot water circuit.

In the absence of hot water circulation in the recovery exchanger, the maximum inlet air temperature is reduced by approximately 2°C compared with the unit without "Total Energy Recovery" mode.

TOTAL OPERATING ENERGY RECOVERY

The pump on the recovery exchanger must be activated when hot water is required. Condensation takes place entirely in the recovery circuit.

R - Total recovery device

A - Unit supply limit

1 - Internal exchanger (evaporator)

2 - Compressor

3 - Recovery exchanger

4 - External exchanger (condenser)

5 - Expansion electronic valve

6 - Pump recovery side (supply and management provided by the Customer)

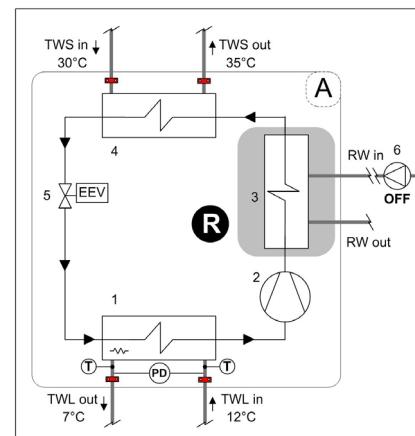

TWS in - Water inlet source side

TWS out - Water outlet source side

TWL in - Water inlet user side

TOTAL NON-OPERATING ENERGY RECOVERY

When the recovery is achieved, the pump on the recovery side must be disabled.

TWL out - Water output user side

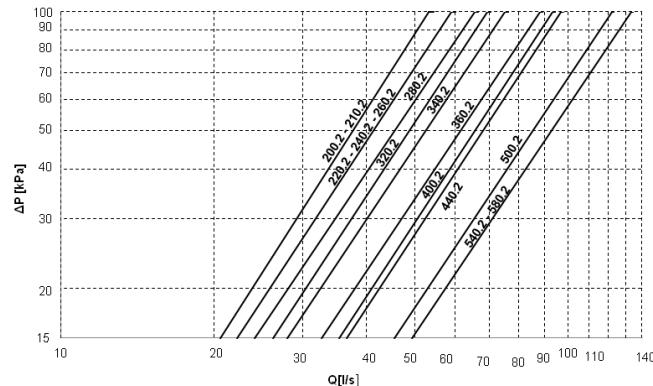

RW in - Recovery water inlet

RW out - Recovery water outlet

T - Temperature probe

PD - Differential pressure switch

Pressure drops of the total energy recovery exchanger

Application of the partial / total energy recovery

In almost all systems fitted with a chiller used to produce chilled water there is also the need to have hot water. The recovery of condensation heat is an efficient way of producing hot water while the chiller is in operation. It has the double benefit of both reducing the heat load to the condenser, thereby eliminating dissipation costs and generating free hot water, thereby reducing the costs of the auxiliary heater.

Application versatility of recovery devices

The hot water produced by heat recovery can be used in a number of ways: to reheat air in handling units, to preheat hot water for domestic use or industrial processes, to heat up water in swimming pools, showers and spas, to preheat hot water for laundries or industrial kitchens.

Post-heating in air handling units to control humidity levels in hospitals and labs

Preheating of hot water for domestic use or for industrial process

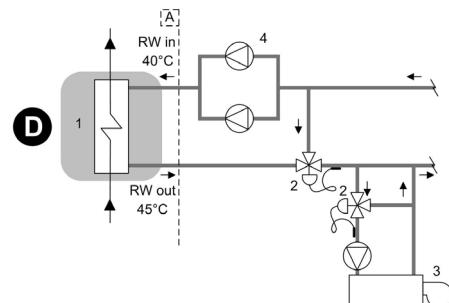

Heating of water in swimming pools, showers and SPAS

Preheating of hot water for laundries and industrial kitchens

Water heating up

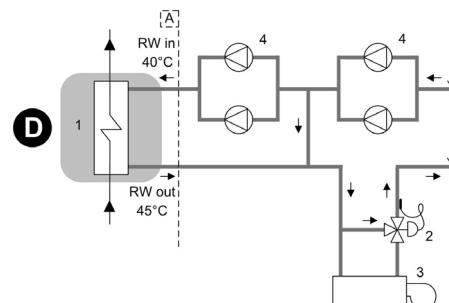

The heat recovery device can be used to cover the entire heat load required. The hot water supply temperature is controlled via a modulating control valve that needs to be fitted on the system at the outlet of the recovery unit. The auxiliary heating device is recommended to cover the thermal energy demand when the chiller is not in operation or is operating at part load.

Example of how heat recovery is used to cover the entire heat demand and control the operating temperature

Water preheating

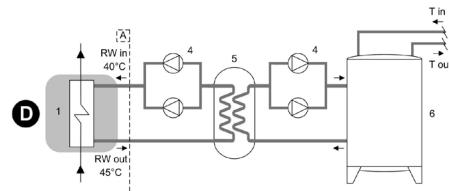

The heat recovery device can be used to preheat water at the inlet of the main heating device (e.g. boiler). In this case, the demand for hot water is greater than the amount of heat recovered by condensation and the recovery device only covers part of the required heat load. By preheating the water, heating consumption levels are therefore reduced and the main heating device has a lower installed power requirement.

Example of how heat recovery is used to preheat hot water in the system

Domestic hot water production

The heat recovery device can be used to produce water for domestic use. In order to prevent contamination of domestic water with the chiller's process fluid, it is necessary to insert an intermediate heat exchanger. Using an inertial heat storage tank allows to have a reserve of preheated water and enables the intermediate exchanger to operate more efficiently.

Example of how heat recovery is used to preheat hot water for domestic use

- A - Unit supply limit
- 1 - Recovery exchanger
- 3 - Auxiliary heating device (ex.Boiler)
- 5 - Intermediate heat exchanger
- RW in - Recovery water inlet
- T in - Drinkable water inlet

- D - Partial energy recovery
- 2 - Control modulating valve
- 4 - Electric pump with standby pump
- 6 - Inertial heat storage
- RW out - Recovery water outlet
- T out - Drinkable water outlet to the auxiliary heater

The diagrams refer to partial energy recovery, though they also apply to total energy recovery (Clivet R). Please note that the diagrams are only meant as a guide.

Accessories - Hydronic assembly

2PM/3PM - HydroPack with no.2/3 pumps

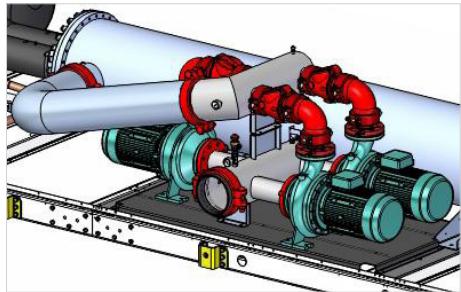

Option supplied built-in the unit. Pumping unit made up of two or three electric pumps laid out in parallel, with auto-adaptive modular logic activation.

It enables the automatic reduction of the liquid flow-rate in critical conditions, avoiding blocks due to overloading and consequential intervention work by specialised technical personnel.

Centrifugal electric pump, with the pump body made of cast iron and the impeller made of AISI 316 stainless steel.

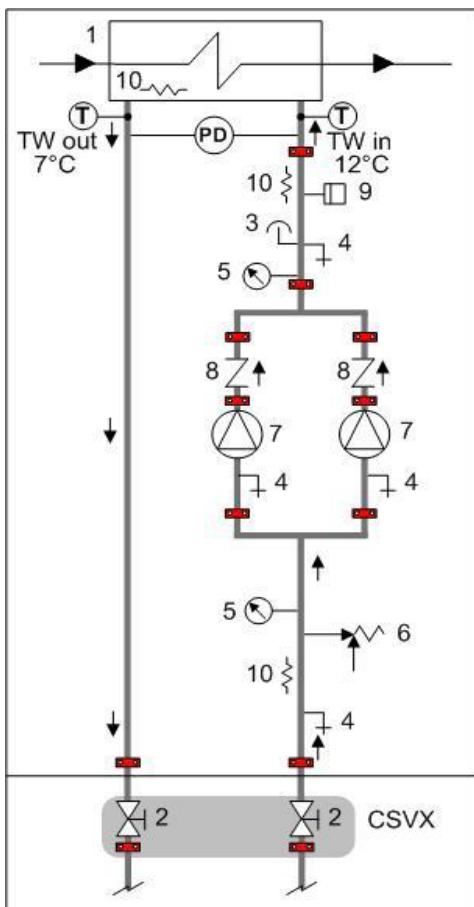

Mechanical seal using ceramic, carbon and EPDM elastomer components.

Three-phase electric motor with IP55 degree of protection. Complete with a thermoformed insulating casing, quick connections with insulated casing, non-return valve, safety valve, pressure gauges, system safety pressure switch, stainless steel antifreeze, intake, immersion-type heaters.

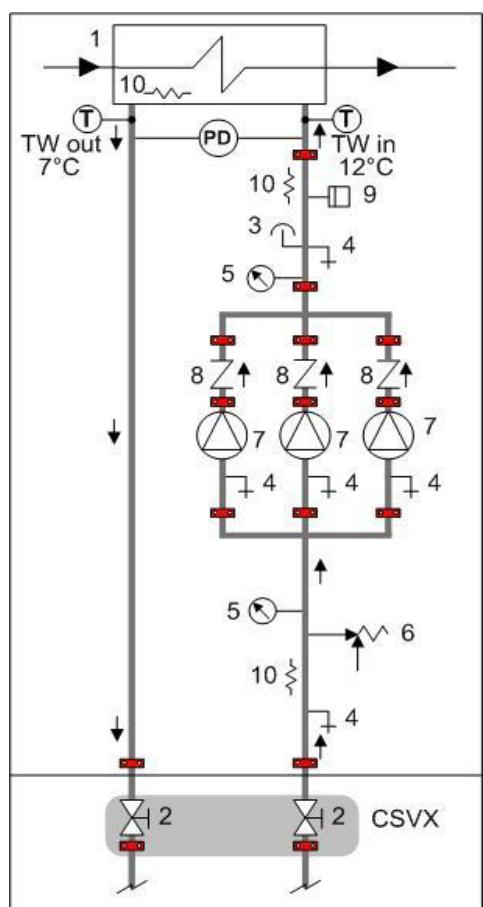

In order to increase the unit's silent operation, as an alternative to electric pumps with a 2-pole motor (2950 rpm), there are also electric pumps with 4-pole motors (1450 rpm), subject to a check regarding the maximum available pressure. The super-silent acoustic configuration (EN) only comes with electric pumps fitted with 4-pole motors.

CONNECTION DIAGRAM - GROUP WITH 2 PUMPS

CONNECTION DIAGRAM - GROUP WITH 3 PUMPS

1 - Internal exchanger

2 - Cutoff valve

3 - Purge valve

4 - Discharge stop valve

5 - Pressure gauge

6 - Safety valve (6 Bar)

7 - Packaged electric pump with high efficiency impeller

8 - Non return valve

9 - System load safety pressure switch (it avoids the pump operation if water is not present)

10 - Antifreeze heater

T - Temperature probe

PD - Differential pressure switch

TW in chilled water inlet

TW out chilled water outlet

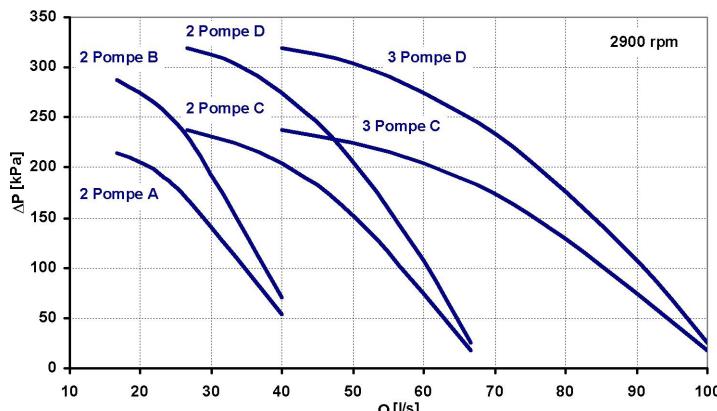

CSVX - Couple of manually operated shut-off valves

The grey area indicates further optional components.

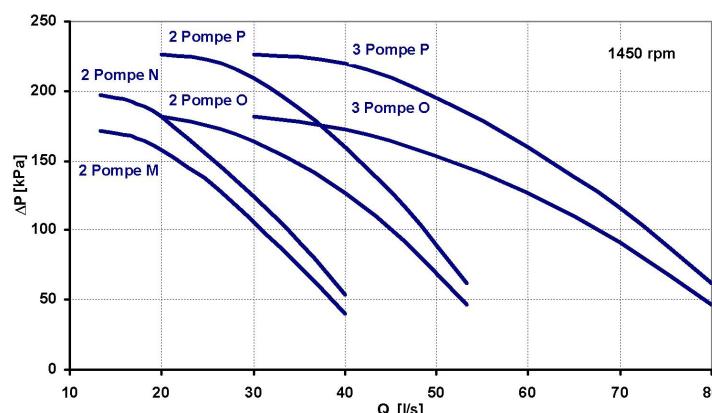

Provide hydraulic interceptions outside the unit ('CSVX - Couple of manually operated shut-off valves' option) to facilitate any possible extraordinary maintenance interventions.

2PM / 3PM option performances (electric pump with 2-pole motor)

- Attention: the evaporator pressure drops have to be taken from the heads represented in these diagrams in order to obtain the available head values.
- Not available with unit in extremely low noise configuration (EN)
- Check availability of the different type of pump with size in the 'Option compatibility' table.

2PM / 3PM option performances (electric pump with 4-pole motor)

- Attention: the evaporator pressure drops have to be taken from the heads represented in these diagrams in order to obtain the available head values.
- Check availability of the different type of pump with size in the 'Option compatibility' table.
- To the internal exchanger pressure drops must be added the pressure drops of the steel mesh mechanical filter (not supplied) that must be placed on the water input line. It is a device compulsory for the correct unit operation and it must be selected and installed by the Customer. It is forbidden the use of filters with the mesh pitch higher than 1,0 mm. Filters with higher mesh pitch can cause a bad unit operation and also its serious damaging.

Electrical data - HydroPack

To obtain the electrical consumption of the unit including the Hydropack accessory, the electrical data of the selected accessory are added to the standard electrical data indicated in the Electrical Data table.

HydroPack			
n° Pumps	Type	[kW]	[A]
2	A	8	15,4
2	B	11	20,8
2	C	15	27,8
2	D	22	40,4
2	M	8	17
2	N	11	22,6
2	O	11	22,6
2	P	15	30,8
3	C	22,5	41,7
3	D	33	60,6
3	O	16,5	33,9
3	P	22,5	46,2

Accessories

PGCC - Condensing coil protection grilles and technical compartment

This accessory is used to protect the external coil from the accidental contact with external things or people.

Ideal for installation in places where persons can pass from, such as car parks, terraces, etc.

The accessory is provided and installed built-in the unit.

This option is not suitable for application in sulphuric environments.

PGCCH - Condensing coil anti-hail protection grilles

These accessories are to protect the external coil from hail damage. Indeed, hail impact can deform the coil fins worsening the heat exchange with the air.

The accessory is provided and installed built-in the unit.

CCCA - Copper / aluminium condensing coil with acrylic lining

Coils with copper pipes and aluminium fins with acrylic lacquering. Can be used in settings with moderately aggressive saline concentrations and other chemical agents.

Attention!

- cooling capacity variation -2.7%
- variation in compressor power input +4.2%
- operating range reduction -2.1°C

CCCA1 - Copper / aluminium condensing coil with Aluminium Energy Guard DCC treatment

A treatment which offers an optimal thermal exchange and guarantees and protects the finned coil exchangers from corrosion over time. Can be used in settings with very aggressive saline concentrations and other chemical agents in the air thus maintaining the performance of the coils over time.

CCCC - Copper / copper condensing coil

Coils with copper pipes, copper fins and brass structure. Can be used in settings with moderately aggressive saline concentrations and other chemical agents.

This option is not suitable for application in sulphuric environments

Option available on request

CREFB - ECOBREEZE external section fans consumption reduction device

An option which regards the external helical fans, as an alternative to the phase-cut device which is supplied as standard in ST and SC versions. It provides for an IP54 brushless electronically commutated electrical motor and incorporated thermal protection. Supplied with variable speed control. Standard for EN version.

CREFO - Device to reduce the consumption levels of on/off fans on the external section

Option that affects the external axial fans, as an alternative of the control device at variable speed, standard supplied. It requires the three-phase electric motor with an external rotor and built-in thermal protection, IP54 in progress. The condensation pressure automatic control occurs by the switching on or off of fans of the whole fan section.

The choice of this option limits the operating range in cooling with outdoor air temperatures higher than +5°C.

PFCP - Power-factor correction capacitors ($\cos\phi > 0.9$)

The component is necessary to lower the phase difference between current and voltage in the electromagnetic components of the unit (e.g. asynchronous motors). The component allows to put the $\cos\phi$ power factor to values on average higher than 0.9, reducing the network reactive power. This often leads to an economic benefit which the energy provider grants to the final user.

The device is installed and wired built-in the unit.

REGBT - Device for the condensing coil partialization

The built-in device allows to extend the unit operating range in cooling down to an outdoor air temperature of -18°C.

CMSC9 - Serial communication module for Modbus supervisor

This enables the serial connection of the supervision system, using Modbus as the communication protocol. It enables access to the complete list of operational variables, commands and alarms. Using this accessory every unit can dialogue with the main supervision systems.

The device is installed and wired built-in the unit.

The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out)

CMSC10 - Serial communication module for LonWorks supervisor

This enables the serial connection of the supervision system which uses the LonWorks communication protocol. It enables access to a list of operating variables, commands and alarms which comply with the Echelon® standard.

The device is installed and wired built-in the unit.

The configuration and management activities for the LonWorks networks are the responsibility of the client.

LonWorks technology uses the LonTalk® protocol for communicating between the network nodes. Contact the service supplier for further information.

The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out)

CMSC11 - Serial communication module for BACnet-IP supervisor

Allows the serial connection to supervision systems by using BACnet-IP as a communication protocol. It allows the access to the entire list of operating variables, controls and alarms. With this accessory every unit can communicate with the main supervision systems.

The device is installed and wired built-in the unit.

The configuration and management activities for the BACnet networks are the responsibility of the client.

The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out)

ECS - ECOSHARE function for the automatic management of a group of units

The device allows automatic management of units that operate on the same hydraulic circuit, by creating a local communication network.

There are two control modes that can be set via a parameter during the activation stage. They both distribute the heat load on the available units by following the distribution logic to benefit from efficiency levels at part load.

Moreover:

Mode 1 - it keeps all the pumps active

Mode 2 - it activates only the pumps of the unit required to operate

The device allows for rotation based on the criterion of minimum wear and management of units in stand-by. There are various unit sizes. Every unit must be fitted with the ECOSHARE feature. The set of units is controlled by a Master unit.

The local network can be extended up to 7 units (1 Master and 6 Slave).

The unit supplied with this device can also be equipped at the same time with the RCMRX option and one of the CMSC9 / CMSC10 / CMSC11 options.

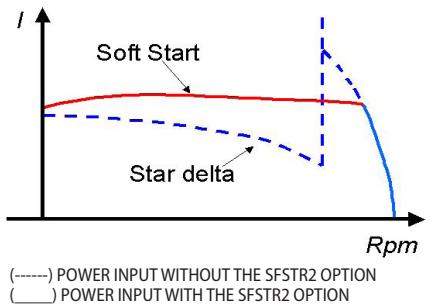

CBS - Compressor magnetothermic circuit breakers

The magnetothermic circuit breakers are inserted instead of the fuses for the protection against the short circuit and overload. In case of intervention they do not have to be replaced, as it happens with fuses.

SFSTR2 - Progressive compressor start-up device

This option is also called 'Soft starter'. Electronic device that automatically and gradually starts the compressors, thereby reducing the current peak generated in star-triangle start-ups and therefore reduces the mechanical stress on the motor and the electrodynamic stress on the power cables and on the mains.

The device is installed and wired built-in the unit.

CONTA2 - Energy meter

Allows to display and record the unit's main electrical parameters. The data can be displayed with the user interface on the unit or via the supervisor through the specific protocol variables.

It is possible to control:

- voltage (V),
- absorbed current (A),
- frequency (Hz),
- cos ϕ ,
- power input (kW),
- absorbed energy (kWh),
- harmonic components (%).

The device is installed and wired built-in the unit.

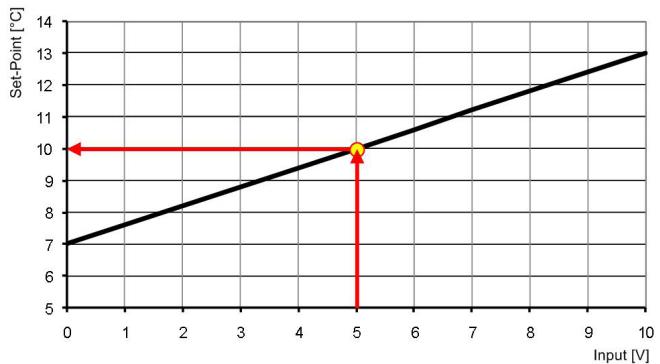

Only the following parameters are available on the LonWorks protocol: power input (kW) and absorbed energy (kWh)

SCP4 - Set point compensation with 0-10 V signal

This device enables the set-point to be varied which is pre-set using an external 0÷10 V signal.

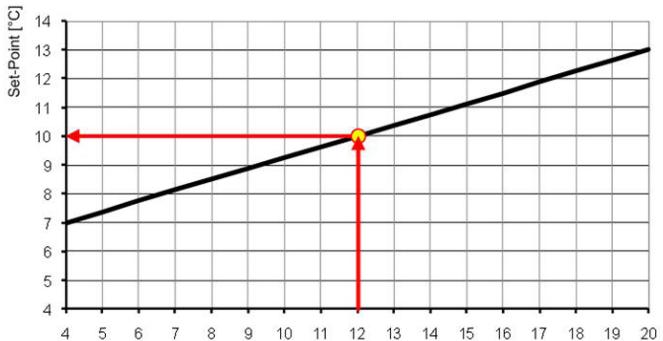

The device is installed and wired built-in the unit.

SPC1 - Set point compensation with 4-20mA signal

This device enables the set-point to be varied which is pre-set using an external 4-20mA signal.

The device is installed and wired built-in the unit.

SPC2 - Set-point compensation with outdoor air temperature probe

This device enables the set-point to be varied automatically which is pre-set depending on the outdoor air temperature. This device enables the liquid flow temperature to be obtained, which varies depending on external conditions, enabling energy savings throughout the entire system.

The device is installed and wired built-in the unit.

The device includes a probe controlled remotely from outside to measure the outdoor air temperature. (installation to be carried out by the customer). The connection cable length is 16 m.

RE-20 / RE-25 / RE-30 / RE-35 / RE-39 - Electrical panel antifreeze protection

This option is necessary for very cold climates, where the external temperature can be between -10°C and -39°C. It includes self-regulating temperature maintaining resistances which are able to protect the electrical panel against condensation and frost guaranteeing that it functions correctly. The choice of device should be carried out on the basis of the minimum temperatures reached at the unit installation site.

The device is built-in the unit.

It is necessary to make precautions against build up of snow and ice in front of the exhaust and outdoor air inlet locations.

This accessory operates even when the unit is switched off provided that the power supply is maintained active and the unit continues to be connected.

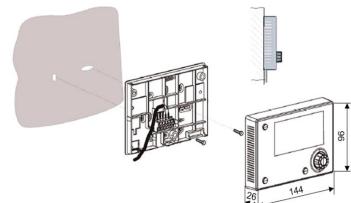

This accessory does not lead to substantial variations in the electrical data for the unit which has been declared in the Electrical Data section.

Accessories separately supplied

RCMRX - Remote control via microprocessor remote control

This option allows to have full control over all the unit functions from a remote position. It can be easily installed on the wall and has the same aspect and functions of the user interface on the unit.

All device functions can be repeated with a normal portable PC connected to the unit with an Ethernet cable and equipped with an internet navigation browser.

The device must be installed on the wall with suitable plugs and connected to the unit (installation and wiring to be conducted by the Customer). Maximum remote control distance 350 m without auxiliary power supply. For distances greater than 350 m and in any case less than 700 m it is necessary to install the 'PSX - Mains power unit' accessory.

Data and power supply serial connection cable n.1 twisted and shielded pair. Diameter of the individual conductor 0.8 mm.

PSX - Mains power supply unit

The device allows the unit and the remote control to communicate with the user interface even when the serial line is longer than 350m.

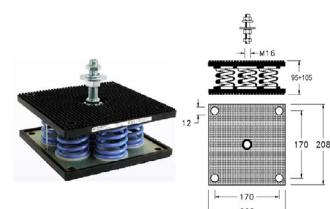

It must be connected to the serial line at a distance of 350m from the unit and allows to extend the length to 700m maximum in total. The device requires an external power supply at 230V AC.

Power supply at 230V AC provided by Customer

AMMX - Spring antivibration mounts

The spring antivibration mounts are attached in special housing on the support frame and serve to smooth the vibrations produced by the unit thus reducing the noise transmitted to the support structure.

CSVX - Couple of manually operated shut-off valves

The kit allows to isolate the input and output water circuit. It includes:

- n. 2 of cast-iron shut-off butterfly valves with fast fittings and activation lever with a mechanical setting lock
- no. 2 quick connections

Installation is a responsibility of the Customer, outside the unit.

kWf = Cooling capacity in kW

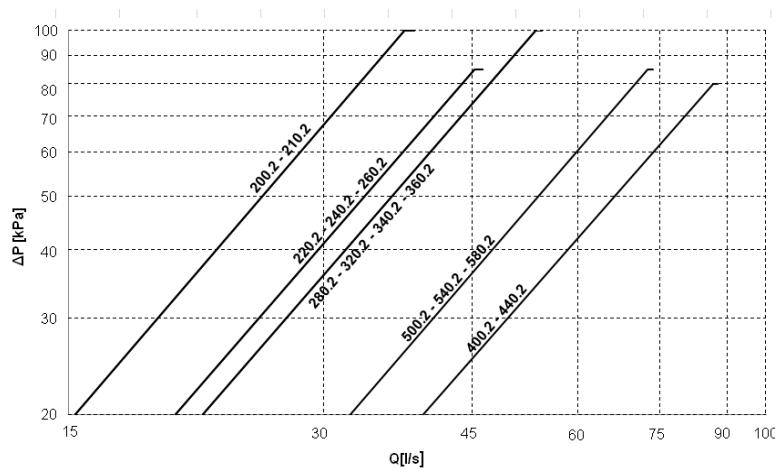

kWe = Compressor power input in kW

To (°C) = internal exchanger outlet water temperature (evaporator)

Performances in function of the inlet/outlet water temperature differential = 5°C

The data do not consider the part related to the pumps, required to overcome the pressure drop for the solution circulation inside the exchangers

Internal exchanger (evaporator) pressure drop

The pressure drops are calculated considering a water temperature of 7°C

Q = water flow-rate[l/s]

DP = water side pressure drops (kPa)

The water flow-rate must be calculated with the following formula

$$Q [l/s] = \text{kWf} / (4,186 \times DT)$$

kWf = Cooling capacity in kW

DT = Temperature difference between inlet / outlet water

To the internal exchanger pressure drops must be added the pressure drops of the steel mesh mechanical filter (not supplied) that must be placed on the water input line. It is a device compulsory for the correct unit operation and it must be selected and installed by the Customer. It is forbidden the use of filters with the mesh pitch higher than 1,0 mm. Filters with higher mesh pitch can cause a bad unit operation and also its serious damaging.

PREMIUM VERSION

Acoustic configuration: standard (ST) / compressor soundproofing (SC)

kWf = Cooling capacity in kW

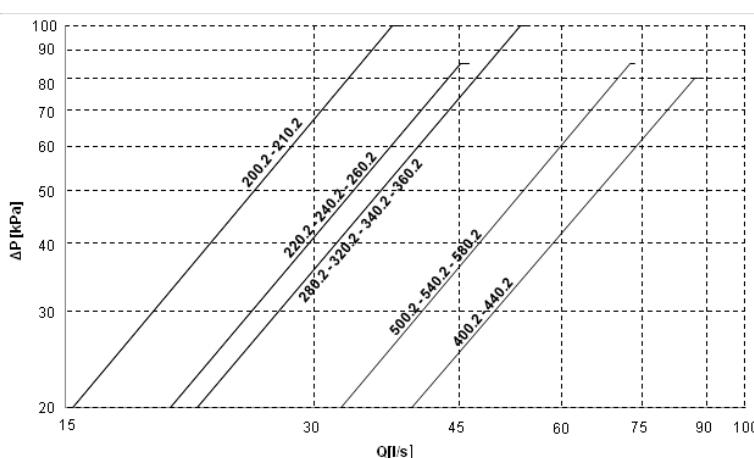

kWe = Compressor power input in kW

To (°C) = internal exchanger outlet water temperature (evaporator)

Performances in function of the inlet/outlet water temperature differential = 5°C

The data do not consider the part related to the pumps, required to overcome the pressure drop for the solution circulation inside the exchangers

Internal exchanger (evaporator) pressure drop

The pressure drops are calculated considering a water temperature of 7°C

Q = water flow-rate[l/s]

DP = water side pressure drops (kPa)

The water flow-rate must be calculated with the following formula

$$Q [l/s] = \frac{kWf}{(4,186 \times DT)}$$

kWf = Cooling capacity in kW

DT = Temperature difference between inlet / outlet water

To the internal exchanger pressure drops must be added the pressure drops of the steel mesh mechanical filter (not supplied) that must be placed on the water input line. It is a device compulsory for the correct unit operation and it must be selected and installed by the Customer. It is forbidden the use of filters with the mesh pitch higher than 1,0 mm. Filters with higher mesh pitch can cause a bad unit operation and also its serious damaging.

kWf = Cooling capacity in kW

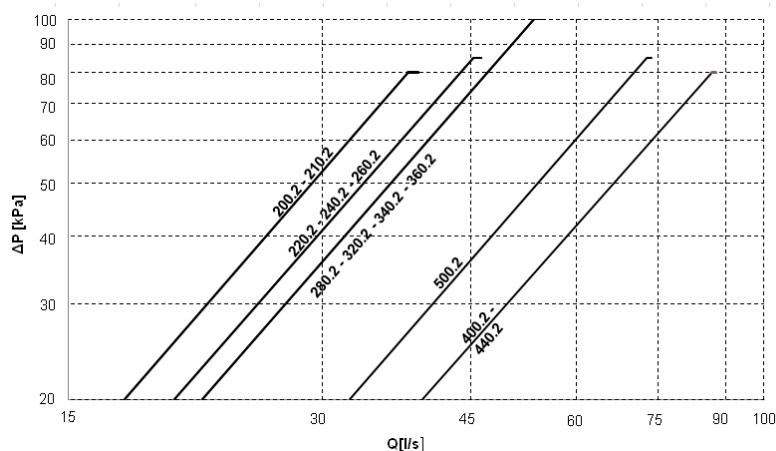

kWe = Compressor power input in kW

To (°C) = internal exchanger outlet water temperature (evaporator)

Performances in function of the inlet/outlet water temperature differential = 5°C

The data do not consider the part related to the pumps, required to overcome the pressure drop for the solution circulation inside the exchangers

Internal exchanger (evaporator) pressure drop

The pressure drops are calculated considering a water temperature of 7°C

Q = water flow-rate[l/s]

DP = water side pressure drops (kPa)

The water flow-rate must be calculated with the following formula

$$Q [l/s] = kWf / (4,186 \times DT)$$

kWf = Cooling capacity in kW

DT = Temperature difference between inlet / outlet water

To the internal exchanger pressure drops must be added the pressure drops of the steel mesh mechanical filter (not supplied) that must be placed on the water input line. It is a device compulsory for the correct unit operation and it must be selected and installed by the Customer. It is forbidden the use of filters with the mesh pitch higher than 1,0 mm. Filters with higher mesh pitch can cause a bad unit operation and also its serious damaging.

EXCELLENCE VERSION

Acoustic configuration: standard (ST) / compressor soundproofing (SC)
